

Application Analytics: Advanced Security at Scale

As applications change more rapidly than ever before, security systems frequently generate tens of thousands — or more — of events per day. Although many events can be mapped to similar behavioral patterns, in practice they are usually viewed and handled separately. For organizations, this means that there is little visibility into how events correlate into meaningful user actions, making it harder for security administrators to pinpoint the actual event that requires attention. Research by the Cloud Security Alliance (CSA) has found that over 40% of security professionals say that alerts they receive lack actionable intelligence, and more than 30% ignore alerts because so many are false positives. The result is that critical alerts frequently go unchecked, leading to higher costs for the organization, greater overhead for staff and lower security for users.

VISIBILITY Consolidates large numbers of events into small numbers of manageable activities

PRECISION Reduces log overload and helps administrators focus on highpriority alerts

CONTROL Provides context about application behavior for rapid troubleshooting

Radware's Cloud WAF Application Analytics is an innovative, new feature designed to provide advanced application security at scale by taking large numbers of similar events and consolidating them into small, manageable sets of recurring activities. This helps to instantly pinpoint security events that need attention and gives context to application behavior. As a result, security administrators are no longer inundated by tens of thousands of individual alerts and gain a frictionless operational experience that helps them deliver fast, effective response to security events.

How It Works

Radware's Cloud WAF Application Analytics employs advanced machine learning and big data analysis algorithms to identify and group similar application events into recurring user activities:

Customer Benefits

Visibility: Simple, Easy-to-Read Details

Cloud WAF Application Analytics takes large numbers of similar events and consolidates them into manageable sets of recurring activities.

Precision: Intelligent Decision-Making

Cloud WAF Application Analytics provides simple, easy-to-understand explanations of security events, thus providing context on application behavior and why certain events are blocked or allowed. This helps security administrators separate the wheat from the chaff and focus on alerts that matter.

0	Details ↑↓
P	Attempt to access administrative location
	HTP.sys in various Microsoft Window operating systems allows remote attackers to execute rbitrary code via crafted HTTP requests
4	ttempt to access a sensitive location, .git folder, which contains source code repository
1	Vordpress XML-RPC Pingback Attack.

Control: Effective Response

Radware's Cloud WAF Portal provides specific information about security events and patterns. It adds a layer of enriched data that gives context and clarity into application behavior. Combined with increased visibility and agility of Application Analytics, this provides security administrators with a frictionless operational experience.
